1184 Novel knot-tying technique for mitral valve repair
H. Izutani, M. Yoshitatsu, J. Kawanoto, and K. Katayama

Cover Photograph

Double aortic arch is an abnormal persisting fourth embryonic arch surrounding the tracheal and esophageal axis and may lead to severe airway compression in infants. Three-dimensional multislice CT scan shows an unusual double aortic arch with hypoplasia of the right arch (Figure 1, A) compressing severely the trachea, which appears narrow; the right and left main bronchi are free of obstruction (Figure 1, B). 1
