Surgical intervention for myocardial bridges: To do or not do to? That is the question

Paul J. Chai, MD

Myocardial bridge, a congenital abnormality in which a portion of the epicardial coronary artery takes an intramural course, can be a controversial topic. Most coronary blood flow occurs in diastole, and so the impact of a myocardial bridge, at least theoretically, should be minimal. Nevertheless, systolic compression of the coronary artery has been associated with angina,1 ventricular dysfunction,2 and even sudden cardiac death,3 and systolic compression of the coronary artery has been demonstrated to impact diastolic flow in the coronary artery.4 In this issue of The Journal of Thoracic and Cardiovascular Surgery, Madea and colleagues5 from Stanford present their experience with the surgical treatment of myocardial bridges in the pediatric population.

Descriptions of 14 pediatric patients treated for myocardial bridge with unroofing of the left anterior descending coronary artery are presented in the article. All patients had symptoms, and patients with other associated lesions (anomalous aortic origin of the coronary artery) were excluded. There were no deaths or major complications, and all patients with symptoms reported improvement. Madea and colleagues5 also demonstrated how their surgical technique has evolved to a more minimally invasive approach.

Some of the limitations of the study include a small patient population and a relatively short follow-up. In addition, the Seattle Angina Questionnaire, which was used to quantify the effectiveness of the procedure, has only been validated among older (60-70 years old) men in the US Department of Veterans Affairs system, and so its accuracy for use in a pediatric population is unclear.

Madea and colleagues5 also demonstrated how their surgical technique has evolved to a more minimally invasive approach.

Central Message

Surgical intervention for myocardial bridges can be a controversial topic. Ultimately, the decision to intervene should be an individualized decision.

See Article page 1618.
